AIMS AND SCOPES

Is to publish original articles on Applied Electromagnetic topics such as:

Antennas and Propagation
Optical Systems and nonlinear optics
Microwave and Millimeter Wavelength Systems
Biomedical Systems
Remote Sensing
Direct and Inverse Scattering

Both theoretical and experimental approaches are welcomed.The journal aims also to promote the cooperation between scientists working on application of electromagnetism internationally and in particular in the Trans Black Sea Region.

PUBLICATION

Institute of Communication and Computer Systems
National Technical University of Athens
9,Iroon Polytechniou str.,15773
Athens - GREECE
Tel: (+301) 7723556
Fax: (+301) 7723557
e-mail:nuzu@central.ntua.gr

Published by electronics technology and distributed by internet and diskettes on request.
Publication period: Querterly.
There will be no publication charges
Expected first issue: October 1997.

INFORMATION FOR AUTHORS

SUBMISSION OF ARTICLES

Review process:
Articles should be submitted through e-mail to the ip address:
email:jae@esd.ece.ntua.gr
Each article will be reviewed by three independent refeeres.Submitted articles should be original and must not have been submitted in parallel to any other journal.

For any suggestions about the server contents please contact by e-mail: jae@esd.ece.ntua.gr

CONTENTS

Microwave Characteristics of BARITT Diodes with Non - Uniform Distribution of Traps Concentration IN TRANSIT-TIME REGION
V. M. Aroutiounian, V. V. Bouniatian 1

Impedance characteristics of the BARITT microwave structures with traps level exponentially distributed in the forbidden gap of the drift (transit - time) region of a semiconductor are examined. It is shown that in results the non-uniform distribution of the traps leads to larger dynamic negative resistance in absolute value in comparison with the case of the uniform distributions of traps.

Stochastic Model of Interaction of Electromagnetic Signal with Oscillator Neural Network
V.G. Spitsyn 12

The model is suggested, which describe transfer of signals in three dimensional oscillator neural network with stochastic connections. Every oscillator has possibility connection with all another oscillators. The process of interaction of signals with oscillators, disposed in spherical region, is investigated. The results of modeling show that decreasing of width of frequency spectrums of signal and oscillators vibrations and its synchronization take place.

Application of the Low Frequency Magnetic Field in the Case of Degenerative Disease
Nencho Todorov, Rumiana Bahchevandjieva, Dimiter C. Dimitrov 20

The present paper describes the system MAGNET-H80M, designed by Prof. Dr. Dimiter C. Dimitrov at the Department of Radiotechnics of Technical University of Sofia, Bulgaria. Depending on the cases suitable inductors are used.

Modeling of Light Scattering by Penetrable Particle Inside a Film Based on Discrete Sources Method

H.Yu. Eremina and A.G. Sveshnikov 25

Our paper is dedicated to analysis of the light scattering by the particle in a film deposited on silicon substrate. The numerical method of investigating the complete mathematical problem is based on the Discrete Sources Method (DSM). It allows us to consider the electromagnetic wave scattering by different kinds of obstacles. The dependence of light scattered intensity by particles of different kind of material, size and location, and for different incidence angles are presented. The validity of total integral response is discussed.

Parametric Effect in HTSC Films
V. M. Aroutiounian, V. V. Buniatian, S.S.Gevorkian 38

Processes in a modulation amplifier on a high temperature superconducting film with nonlinear parametric inductance and active resistance are theoretically examined. The expression is obtained in this paper for the average power on the inductance. A possibility of a parametric regeneration on the modulation frequency of

the surface impedance of a HTSC film offers at the irradiation of the latter by an optical radiation modulated on the intensity.

Application of Pulsed GaAs Diode Laser to High Resolution Molecular Spectroscopy and Atmospheric Monitoring

S.Penchev, V.Naboko, V.Pencheva, S.Naboko 52

New aspects of application of pulsed GaAs diode lasers are discussed, concerning high - resolution molecular spectroscopy in the near infrared spectrum and atmospheric monitoring. Utilising optimal photodetection technique, an absorption spectrum of 8990-9012 Å wavelength, assigned as third oscillatory molecular overtone (3,0,0) of water vapour, was investigated. The measured relative frequency difference, coefficients of absorption and linestrengths of Doppler- and collision-broadened spectral lines are presented with relevance to the theoretical spectrum. Monitoring of atmospheric humidity, based on the relevant diode laser and a method employing linestrength data in the relevant spectral range to open-path measurements, reveals the potential for complex atmospheric studies.

Preliminary Results on the FDTD Analysis of Intefrated Active Circulator Antennas

C. Kalialakis , M.J.Cryan, P.S.Hall, P.Gardner 60

Active integrated antennas involve integration of active devices with antennas. Compact and low cost configurations are expected to be very important in near future wireless applications. Many configurations used are based on microstrip antennas with the active devices mounted on the same substrate with the antenna. Electromagnetic modelling of these modules requires a full wave approach due to the close interaction of the circuit with the radiator. The extended FDTD method, by inclusion of circuit elements,, is a computational method that can concurrently model the circuit and the antenna parts.
