AIMS AND SCOPES

Is to publish original articles on Applied Electromagnetic topics such as:

Antennas and Propagation
Optical Systems and nonlinear optics
Microwave and Millimeter Wavelength Systems
Biomedical Systems
Remote Sensing
Direct and Inverse Scattering

Both theoretical and experimental approaches are welcomed.The journal aims also to promote the cooperation between scientists working on application of electromagnetism internationally and in particular in the Trans Black Sea Region.

PUBLICATION

Institute of Communication and Computer Systems
National Technical University of Athens
9,Iroon Polytechniou str.,15773
Athens - GREECE
Tel: (+301) 7723556
Fax: (+301) 7723557
e-mail:nuzu@central.ntua.gr

Published by electronics technology and distributed by internet and diskettes on request.
Publication period: Querterly.
There will be no publication charges

INFORMATION FOR AUTHORS

SUBMISSION OF ARTICLES

Review process:
Articles should be submitted through e-mail to the ip address:
email:jae@esd.ece.ntua.gr
Each article will be reviewed by three independent refeeres.Submitted articles should be original and must not have been submitted in parallel to any other journal.

For any suggestions about the server contents please contact by e-mail: jae@esd.ece.ntua.gr

CONTENTS

A Generalized Three Dimensional Global Analysis of MMIC Structures
R. Makri , M. Gargalakos , and N.K. Uzunoglu 1

A generalized three dimensional global analysis technique is presented for Monolithic Microwave Integrated Circuit (MMIC) structures based on a full wave approach using integral equation techniques. The MMIC structures are taken to have an arbitrary geometry consisting of orthogonal parallelepiped blocks having specific electrical characteristics. Then an integral equation method is employed to obtain a rigorous formulation. The use of Green's function theoretic approaches provides a generalized formulation allowing modeling of arbitrary geometries. The numerical solution of the corresponding integral equations is obtained by using a Galerkin technique leading into a highly numerical solution. The modeling of two port MMIC is achieved by considering the connection of the three dimensional circuit structure into input – output microstrip lines. A novel approach to treat the incident – reflected and transmitted waves at the input and output microstrip lines is proposed based on singular integral theory. Numerical results are computed for a specific structure and presented.

Optical CDMA System Based on Active Fiber Bragg Gratings Chain
H.V.Baghdasaryan, D.M.Meghavoryan 11

By applying of numerical models the performance analysis of frequency encoded fiber optic CDMA techniques for using in LANs is presented. The possibility of using active Bragg gratings chain as a coder and correlator is shown. Newly obtained numerical results are discussed.

Development of an Electrical Impedance Tomography System: Data Collection and Reconstruction Algorithm
G. A. Kyriacou, P. M. Bonovas, C. S. Koukourlis and J. N. Sahalos 17

A detailed step-by-step procedure for the development of an Electrical Impedance Tomography (EIT) system is presented. This is identified into three major tests: the "computer", the "laboratory or in-vitro" and the "clinical or in-vivo" with an increasing difficulty. This work deals with the first two of them. First the EIT basic principles are reviewed and later both the measurements - data collection and reconstruction algorithm procedures are explained. The development of resistive network and the tank laboratory phantom as well as the comparison of the measured and calculated results is then considered. Finally, reconstructed images from both laboratory phantoms are presented and compared against the target models.

Application of the modified Method of Auxiliary Sources for the analysis of Microstrip Antennas
Ph. Shubitidze, R. Zaridze, D. Ecomomou, D. Kaklamani, N. Uzunoglou 41

The modified method of auxiliary sources (mMAS) is applied for the analysis of planar microstrip antennas. The principle idea of mMAS is based on the concept of

assuming auxiliary unknown current and charge density distribution on an auxiliary surface, which is usually taken to be conformal to the real surface. Applying the current contribution law the charge density is determined out of the current components flowing on the auxiliary surface. The respective boundary conditions on the conductors and the substrate material are utilized to solve for the auxiliary current on the auxiliary surface. The substrate material could be lossless, loss or inhomogeneous dielectric as well as complex material. Numerical results are presented for planar microstrip antenna cases, concerning near field and far field calculations. The validation of the results is confirmed by the satisfaction of all appropriate boundary conditions.

Unequal Error Protection Star 16 - QAM Scheme for Fixed Digital Radio Communications
Nikolay Kostov **55**

An unequal error protection (UEP) modulation scheme using star 16-level quadrature amplitude modulation (QAM) is proposed. The proposed UEP 16-QAM scheme allows efficient source-matched digital transmission over fixed microwave radio channels with 4 b / s / Hz throughput. Comparisons to other 16-QAM schemes are given along with performance results on a Gaussian channel.
